4.Host a multi-instance wordpress behind AWS ALB. Create the infrastructure using Terraform
- ● Write one or more modules to build infrastructure.
- ● Install wordpress using ansible provisioner.

MyWork:

- ● Create infrastructure in aws like ec2 instance, target group, security group for alb and ec2 instances, alb.
- ● Output the dns of alb
- ● By using local-exec provisioner, use ansible playbook to configure wordpress installation in the provisioned ec2 instance.

Output:
